

Mantodea (Insecta) of Nepal: an annotated checklist

REINHARD EHRMANN, Karlsruhe & MATTHIAS BORER, Basel

Zusammenfassung

Basierend auf umfangreichen Literatur-Recherchen, sowie der Bearbeitung von 13 Museumssammlungen können für Nepal 49 Mantodea-Arten nachgewiesen werden. Die Gattung *Rhombomantis* gen. nov. wird neu beschrieben. Folgende Gattung und sechs Arten werden synonymisiert respektive neu kombiniert: *Parahestiasula* Lombardo, 1995 syn. nov. von *Ephestiasula* Giglio-Tos, 1915; *Rhombomantis butleri* (Wood-Mason, 1878) comb. nov. von *Rhombodera butleri* Wood-Mason, 1878; *Rhombomantis fusca* (Lombardo, 1992) comb. nov. von *Rhombodera fusca* Lombardo, 1992; *Rhombomantis woodmasoni* (Werner, 1931) comb. nov. von *Rhombodera woodmasoni* Werner, 1931; *Ephestiasula obscura* (Lombardo, 1995) comb. nov. von *Parahestiasula obscura* Lombardo, 1995; *Mantis religiosa akbari* Soomro et al., 2001 syn. nov. von *Mantis religiosa inornata* Werner, 1930; *Hierodula brachynota* Wang & Dong, 1993 syn. nov. von *Rhombomantis fusca* (Lombardo, 1992). Für acht Arten gibt es keinen gesicherten Nachweis. Eine aktuelle und kommentierte Checkliste der in Nepal nachgewiesenen Arten wird erstellt. Die 49 der in Nepal vorkommenden Arten werden in alphabetischer Reihenfolge abgebildet.

Summary

Based on substantial literature research and examination of 13 museum collections, 49 species of Mantodea can be listed for Nepal. The genus *Rhombomantis*, gen. nov. is described for the first time. The following genus and six species are synonymized or newly combined: *Parahestiasula* Lombardo, 1995 syn. nov. of *Ephestiasula* Giglio-Tos, 1915; *Rhombomantis butleri* (Wood-Mason, 1878) comb. nov. from *Rhombodera butleri* Wood-Mason, 1878; *Rhombomantis fusca* (Lombardo, 1992) comb. nov. from *Rhombodera fusca* Lombardo, 1992; *Rhombomantis woodmasoni* (Werner, 1931) comb. nov. from *Rhombodera woodmasoni* Werner, 1931; *Ephestiasula obscura* (Lombardo, 1995) comb. nov. from *Parahestiasula obscura* Lombardo, 1995; *Mantis religiosa akbari* Soomro et al., 2001 syn. nov. of *Mantis religiosa inornata* Werner, 1930; *Hierodula brachynota* Wang & Dong, 1993 syn. nov. of *Rhombomantis fusca* (Lombardo, 1992). The presence of eight species mentioned in the literature for Nepal is not confirmed. An updated and annotated checklist of Mantodea from Nepal is provided. Out of 49 species present in Nepal, 48 are illustrated in alphabetical order.

Key words: Mantodea, Nepal, taxonomy, checklist, new genus, new synonym, new combination

Introduction

In the last century, few articles focusing on the Mantodea fauna of Nepal have been published. One work investigated the behaviour of *Mantis religiosa* ANONYMOUS (1907) and three faunistic studies were conducted by CHOPARD & DREUX (1966), INGRISCH (1987) and KOBLIK et al. (2000) in which three, five and seven species of Mantodea, respectively, are listed for Nepal.

LOMBARDO (1993) published a study about the Mantodea fauna of Nepal and listed 20 species. 17 were already known, and three were new to Nepal. The following three further species were described as new to science: *Acromantis elegans*, *Memantis anomala* und *Sceptuchus baehri*.

Since Nepal borders in the west, south and east the following five Indian states, Uttarakhand (DAS 2012), Uttar Pradesh, Bihar, West Bengal and Sikkim, it was essential to take into account publications dealing with the Mantodea fauna of India, in which species from Nepal are sometimes cited (EHRMANN 2002, 2005, GHATE 2002, 2012, MUKHERJEE 1995, 2014, SURESHAN 2004, 2006, 2010).

During the past 20 years, general collecting activity in Nepal, even if not targeted on praying mantids, has increased and has led to a growing number of Mantodea deposited in museum and private collections. The increasing number of specimens, whether mentioned in the literature or deposited in collections, encouraged the authors to build an updated checklist of these charismatic insects.

Material and Method

In order to have access to the relevant characters for determination, 73 out of the 166 museum specimens investigated were softened and re-prepared.

Photographs of specimens were taken by Reinhard Ehrmann,

with a Canon PowerShot A630 digital camera and processed using Adobe Photoshop 8.0.1.

The authors followed the classification of Ehrmann & Roy (in EHRMANN 2002) and ROY (2014). The genera and species are cited in alphabetical order.

Material examined is deposit in the following collections:

ANSB	Academy of Natural Sciences, Philadelphia, Pennsylvania, U.S.A.
BMNH	British Museum Natural History, London, United Kingdom
DBUC	Dipartimento di Biologia Animale, Università die Catania, Catania, Sicily, Italy
IEAS	Institute of Entomology, Academia Sinica, Shanghai, China
IFRI	Indian Forest Research Institute, Dehra Dun, Uttar Pradesh, India
LSUK	Linnean Society, United Kingdom, London

ZMUC	Zoological Museum and University, Copenhagen, Denmark
ZMUH	Zoologisches Institut und Zoologisches Museum der Universität, Hamburg, Germany
ZSM	Zoologische Staatssammlung, München, Germany

Results

This checklist includes all Mantodea species known to date from Nepal. They belong to 8 families, 15 subfamilies, 13 tribes, 28 genera and 49 species. The following four species are endemic to Nepal: *Acromantis elegans* Lombardo, 1993; *Acromantis grandis* Beier, 1930; *Parahestiasula obscura* Lombardo, 1995 and *Sceptuchus baehri* Lombardo, 1993.

The authors found no evidence for the occurrence of the following eight species, cited in literature as supposedly occurring in Nepal: *Acromantis insularis* Giglio-Tos, 1915; *Amantis fuliginosa* (Werner, 1931); *Bolivaria xanthoptera* (Olivier, 1792), *Dysauless himalayanus* (Wood-Mason, 1889), *Euthyphleps rectivenis* (Wood-Mason, 1889), *Mesopteryx alata* Saussure, 1870, *Nemotha mirabilis* Beier, 1933 and *Ormomantis indica* (Giglio-Tos, 1915). The Mantodea examined were collected between 115 m a.s.l. (*Hierodula unimaculata*) and 2000 m a.s.l. (*Tenodera aridifolia*).

Annotated checklist

Acromantis Saussure, 1870

Acromantis Saussure, 1870: 229.

Type generis: *Mantis oligoneura* De Haan, 1842: 90-91, pl. 18, fig. 6 (male and female) (Indonesien).

Acromantis elegans Lombardo, 1993

Acromantis elegans Lombardo, 1993: 202-203, fig. 10a-10c.
= *Acromantis elegans*. In: EHRMANN 2002: 52 (male and female) (Nepal).
= *Acromantis elegans*. In: OTTE & SPEARMAN 2005: 67 (male and female) (Nepal).

Size: Medium-sized (body length in mm: male unknown, female unknown).

Type material: Holotype male, Nepal: Prov. Chisipani Garhi Bhainse Dobhan 730 m, leg. W.Dierl & W.Schacht, 16.-20. VII.1967, not found in ZSM, in DBUC ?, Paratype female, Nepal: Rapti Tal, Monahari Khola, Belwa 350 m, leg. W.Dierl, W.Forster & W.Schacht, 10.V.1967, not found in ZSM, in DBUC ?.

Distribution: Nepal.

Acromantis grandis Beier, 1930 Fig. 1

Acromantis grandis Beier, 1930: 454-455 (female).
= *Acromantis grandis*. In: BEIER 1934: 13 (Tonkin = Vietnam).
= *Acromantis grandis*. In: MARSHALL 1975: 316 (type catalog, Holotype female, [Vietnam (north)] Tonkin, Than-Moi, VI.-VII.- (H. Fruhstorfer).
= *Acromantis grandis*. In: LOMBARDO 1993: 203.
= *Acromantis grandis*. In: EHRMANN 2002: 53 (female) (Nepal, Vietnam).
= *Acromantis grandis*. In: OTTE & SPEARMAN 2005: 67 (female) (Tonkin = Vietnam).

Size: Medium-sized (body length in mm: male 28, female 41).

Type material: Holotype female, [Vietnam-N] Tonkin, Than-Moi, VI.-VII. (Fruhstorfer), BMNH.

Records: **ZSM:** Nepal: Jubing 1600 m, leg. W.Dierl, 03.-13.V.1964, det. Max Beier (male).

Distribution: Nepal.

Amantis Giglio-Tos, 1915

Amantis Giglio-Tos, 1915c: 151.
= *Cimantis* Giglio-Tos, 1915c: 154.
= *Amantis*. In: GIGLIO-TOS 1919: 59.
= *Cimantis*. In: GIGLIO-TOS 1919: 59.
= *Cimantis*. In: BEIER 1935: 28 (as a new synonym).
= *Shirakia* Beier, 1935: 47 (type *Gonypteta maculata* Shiraki, 1911: 318, fig. pl. 12, fig. 6, 6a) (Japan, Formosa).
= *Shirakia*. In: EHRMANN 2002: 56 (as a synonym).
= *Shirakia*. In: OTTE & SPEARMAN 2005: 143 (maculata as synonymous) (Japan).

Type generis: *Mantis (Oxypilus) reticulata* De Haan, 1842: 87 (#9), pl. 17, fig. 9 (male) (Java).

Amantis bolivarii Giglio-Tos, 1915 Fig. 2, 3

Amantis bolivarii Giglio-Tos, 1915c: 153.
= *Iridopteryx reticulata* Brunner de Wattenwyl, 1893: 65 (female) (Myanmar) (depository unknown).
= *Amantis bolivarii*. In: GIGLIO-TOS 1927: 171 (male and female) (Himalaya, Myanmar).
= *Amantis bolivarii*. In: BEIER 1935: 28 (Himalaya, Myanmar).
= *Amantis bolivarii*. In: MUKHERJEE, HAZRA & GHOSH 1995: 265 (male and female), figs. 80-82 (female), (India, Myanmar).
= *Amantis bolivarii*. In: EHRMANN 2002: 56 (male and female) (India, Myanmar, Nepal).
= *Amantis bolivarii*. In: OTTE & SPEARMAN 2005: 141 (male and female) (Myanmar, Nepal).
= *Amantis bolivarii*. In: GHATE, JADHAV, SURESHAN & SHARMA 2012: 17 (male and female) (India, Myanmar, Nepal).
= *Amantis bolivarii*. In: MUKHERJEE, EHRMANN & CHATTERJEE 2014: 24 (male and female) (Myanmar, Nepal).

Size: Small (body length in mm: male 17, female 19).

Type material: Holotype male, Kurseong in Himalaya, NHMW, Paratype female, Myanmar-SW: Tenasserim, MSNG.

Distribution: India, Myanmar, Nepal.

Records: **SMNK:** Nepal: Bhaktapur, 27.40N-85.25E, im Kathmandu Tal, 13 km SE Kathmandu, leg. U.Sellenschlo, XI.1986 (male #05720); Nepal: Prov. Koshi, 26.49.41N-87.09.19E, Tashigaon bis Sedua, 1600-2100 m, leg. J.Weipert, 12.X.2002 (female #11908) (ex coll. NME).

Remarks: Locus typicus: Kurseong [Kurseong, city centre ($26^{\circ}52'55.96''N$ - $88^{\circ}16'43.86''E$)] is a city at 1500 m.a.s.l. in the district of Darjeeling in the Indian state of West Bengal, at the southeastern foothills of the Himalayas. Kurseong is situated about 32 km in the south of the city centre of Darjeeling and only 12 km in the east of the border to Nepal.

***Ephestiasula* Giglio-Tos, 1915**

Ephestiasula Giglio-Tos, 1915b: 101.

Hephestiasula (err. descr.) In: LOMBARDO 1993: 206.

= *Parahestiasula* Lombardo, 1995: 11; (syn. nov. Ehrmann & Borer).

Type generis: *Hestias pictipes* Wood-Mason, 1879: 258 (male and female) (India).

***Ephestiasula obscura* (Lombardo, 1995) comb. nov. Fig. 21**

= *Parahestiasula obscura* Lombardo, 1995: 12-14, fig. 1-5 (male).

= *Parahestiasula obscura*. In: EHRMANN 2002: 263.

= *Parahestiasula obscura*. In: OTTE & SPEARMAN 2005: 82.

Size: Small to medium-sized (body length in mm: male 23, female 27).

Type material: Holotype male, Paratypes 3 females, ZSM, Paratype female #06689, SMNK, Paratype female, DBUC, all same data: Nepal: Rapti-Tal, Monahari Khola, Belwa 350 m, leg. W.Dierl, W.Forster & W.Schacht, 07.-12.V.1967.

Distribution: Nepal.

Remarks: Lombardo described in 1995 the genus *Parahestiasula* with the species *obscura* from the Rapti Valley. Upon detailed examination, the authors realised, together with C. Schwarz and T. Schulze, that the genus *Parahestiasula* is identical to the genus *Ephestiasula*. The genus was thus synonymised and the species *obscura* was classified under *Ephestiasula*. Consequently, *Parahestiasula* is a new synonym of *Ephestiasula* Giglio-Tos, 1915 and *Ephestiasula obscura* (Lombardo, 1995) the new combination.

Size: Medium-sized to large (body length in mm: male 32-37, female 47-54).

Type material: Type material: Syntype female (#2614) (MN-CN-Ent #140643), Kurseong in Himalaya, MNMS (=MNCN) (Type not in MZBS), all data in litt. 14.V. and 10.VI.2015 Evgeny Shcherbakov);

Synonym: *D. viridis*: Holotype male, India-NE: Sikkim, Staudinger, ex coll. Brunner de Wattenwyl (#22.423) (#504) NHMW.

Distribution: Bhutan: 1 male NMB, 1 male SMNK; India-NE: 1 male NHMW, 1 female MNMS, 2 males ZSM; Nepal: 1 female SMNK, 1 male ZSM.

Records: **SMNK:** Nepal: Bartār, 28.07N-84.24E, 2150 m, lux, leg. G.Lebisch & H.Probst, 07.-29.VI.1988 (female #03625); **ZSM:** Nepal: Kathmandu Valley, Godavari, 1600-1800 m, leg. W.Dierl & W.Schacht, 06.VI.1967 (male).

Remarks: Locus typicus: Kurseong [Kurseong, city centre ($26^{\circ}52'55.96''N - 88^{\circ}16'43.86''E$)] is a city at 1500 m.a.s.l. in the district of Darjeeling in the Indian state of West Bengal, at the southeastern foothills of the Himalayas. Kurseong is situated about 32 km in the south of the city centre of Darjeeling and only 12 km in the east of the boarder to Nepal.

= *Hestiasula brunneriana*. In: SAUSSURE, 1871d: 454-455 (female) (Indes orientales: Sylhet).

= *Hestias brunneriana*. In: WOOD-MASON 1876: 175.

= *Hestias brunneriana*. In: WOOD-MASON 1879: 258-259.

= *Hestias* Wood-Mason, 1884: pl. 13, fig. 1-1b.

= *Hestiasula ceylonica* Beier, 1956: 39-40 (male) (Sri Lanka) (synonym?).

Size: Small to medium-sized (body length in mm: male 21, female 26-29).

Type material: Holotype female, India-N: Sylhet (coll. Brunner v. Wattenwyl) (#531), NHMW.

Distribution: India, Nepal, Pakistan-W, Sri Lanka.

Records: **SMNK:** Nepal: P: Mahakali, D: Kanchanpur, 17 km NE Mahendranagar, vic. Bedkol lake, $29^{\circ}01'25''$ - $80^{\circ}19'09''E$, ca. 500 m NN, leg. J.Küßner, 02.VII.2009 (female #12463) (ex coll. NME).

Remarks: *Hestiasula brunneriana* found in Nepal and India show a variation in colour pattern on the inner surface of femur at the foreleg (WOOD-MASON 1884: pl. 13, fig. 1b; MUKHERJEE et al. 1995: 220-221; SURESHAN 2010: 13-14, fig. 19). In addition to the three black stripes, a black dot above the claw groove is present in some individuals (Fig. A). The authors interpret this variation as an intraspecific phenomenon. To support this hypothesis, more specimens, as well as the male genitalia, need to be studied.

The private collection of Tobias Schulze contains one male and three female specimens from Goa (West-India). These

Figure A: Female *Hestiasula brunneriana*, left foreleg, inner surface of femur: I) three stripes with black dot above claw groove, Nepal (SMNK #12463); II) three stripes without black dot above claw groove, Sri Lanka (SMNK #03689). Photos by R. Ehrmann.

vary in the expression of the black dot above the claw groove from clearly present to absent. The same collection harbours one female and three male specimens from the state of Tamil Nadu (South-East India), all lacking the black dot above the claw groove.

= *Iris orientalis*. In: MUKHERJEE, EHRMANN & CHATTERJEE 2014: 17 (male and female) (India, Nepal, Pakistan).

Size: Medium-sized (body length in mm: male 30-40, female 39-42).

Type material: Lectotype male (#6508/1), Paralectotype male and female, NW-Himalaya: Kulu Valley, Kangra, NZSI; Lectotypes 2 females, India, OUMNH.

Distribution: Afghanistan, India, Nepal, Pakistan.

Records: **SMNK:** Nepal: Betrāwati, 27.58N-85.11E, am Fluß, 1600 m, leg. G.Lebisch & H.Probst, 07.-29.VI.1988 (male #04723 and female #04724).

Remarks: Wood-Mason (1882) indicates “Kulu Valley, Kangra, in the N.-W. Himalayans” as locality. The authors point out that today Kullu (=Kulu), [Kullu city centre (31°57'28.82"N - 77°06'34.11"E, 1231 m.a.s.l)] and Kangra, [Kangra city centre (32°06'04.91"N - 76°16'22.65"E, 710 m.a.s.l.)] are two distinct cities in the Indian state of Himachal Pradesh, at the southern foothills of the north-western Himalayas. Kullu is situated about 80 km south-east of Kangra and both cities are located about 480 km and 395 km, respectively, north-west of the Nepalese border

Rhombomantis gen. nov.

Type generis: *Hierodula* (*Rhombodera*) *butleri* Wood-MASON, 1878b: 580-581 (male and female), pl. 36, fig. 3, 3a-3b (female) (India).

Remarks: Dr. Alfred Peter Kaltenbach† (1920-2005), formerly working at the NHMW, described in an unfinished manuscript with the title „Beiträge zur Kenntnis der Mantodea-Fauna von Thailand“ a new subgenus, *Rhombomantis* subgen. nov. Kaltenbach† 2005.

Diagnosis

Kaltenbachs citation is:

„Die von LOMBARDO 1992, unter *Rhombodera* beschriebene Art *fusca* bildet mit *Rhombodera butleri* WOOD-MASON, 1878, und *Rh. woodmasoni* WERNER, 1931, eine Gruppe nahe verwandter Arten, die durch die charakteristische Form des Pronotum ausgezeichnet sind. Die drei Arten weisen eine gewisse Ähnlichkeit mit der Gattung *Rhombodera* auf, stehen aber doch *Hierodula* näher. Die Aufstellung eines neuen Subgenus erscheint daher gerechtfertigt.“

The authors agree with the opinion of Kaltenbach that the three above-mentioned species differ from the rest of the *Rhombodera* species in the shape of their pronotum.

The shape of the pronotum being dissimilar from those of the genus *Hierodula*, the authors transfer the three species

(*Rhombodera fusca*, *Rhombodera butleri* and *Rhombodera woodmasoni*) in a new genus and adopt the name „*Rhomgomantis*“, suggested by Kaltenbach.

In the systematic classification, *Rhomgomantis gen. nov.* should be placed between the genus *Hierodula* and *Rhombodera* and includes the following three species: *Rhomgomantis fusca* (C-I, C-III), *Rhomgomantis butleri* (C-II) and *Rhomgomantis woodmasoni* (C-IV). *Hierodula brachynota* Wang & Dong, 1993 (C-I) has to be considered as a *syn. nov.* of *Rhomgomantis fusca* (Lombardo, 1992).

Description:

The pronotum of *Rhomgomantis* is short, elongated to rhomboid (never round) and, lateral, with a narrow lamellar extension (Fig. C). The latter extends from the metazona to the basis of the pronotum.

The spination pattern of the raptorial legs, consisting of the coxa, the femur (4 discoidal spines and 4 postero-ventral spines) and the tibia (9-11 postero-ventral spines), is not significantly different between the genera *Hierodula*, *Rhombodera* and *Rhomgomantis*. This anatomical feature can therefore not be used to distinguish the three genera from each other.

The hypophallus in the four above-mentioned species (*Hierodula brachynota* *syn. nov.* of *Rhomgomantis fusca* (D-I), *Rhomgomantis butleri* (D-II), *Rhomgomantis fusca* (D-III) and *Rhomgomantis woodmasoni* (D-IV)) is structurally very similar, and is barely comparable to those of the genera *Hierodula* and *Rhombodera*.

The genera *Hierodula* Burmeister, 1838 and *Rhombodera* Burmeister, 1838 can be distinguished by the shape of their pronotum. The latter is divided by the supracoxal dilatation into an upper and lower part, the prozona and the metazona, respectively.

In the genus *Hierodula* (B-I), the supracoxal dilatation of the pronotum has no significant lamellar extension and is clearly visible due to the distinct cranial and caudal narrowing of the prozona and the metazona, respectively.

In the genus *Rhombodera* (B-II, III), the supracoxal dilatation of the pronotum exhibits a significant lamellar extension of the prozona and the metazona and is therefore not as pronounced as in the genus *Hierodula*. The lamellar extension stretches from the metazona to the basis of the pronotum. The shape of the pronotum can be elongated (B-II) or round (B-III).

However, to ensure the distinction between the genera *Hierodula*, *Rhombodera* and *Rhomgomantis* a revisional work based on morphological investigation, combined with molecular analysis is needed.

H.Lehmann, III.1987 (male and female).

Remarks: WANG & DONG (1993) described the species *brachynota* from Yunnan, China, and classified it in the genus *Hierodula*. With the aid of Dr. Chao Wu (Chinese Academy of Science, Institute of Zoology, Beijing, China = IZCAS), the authors examined *Hierodula brachynota* and realised the equality with *Rhomgomantis fusca*. Consequently, *Hierodula brachynota* = *Rhomgomantis fusca* *syn. nov.*

Type material: Holotype female, location not known, MHNG; Synonym: *M. (M.) chloreudeta*: Type male and female, Japan, RMNH;

Synonym: *M. mandarinea*: Type male, China, RMNH.

Distribution: China, Japan, Micronesia, Thailand, in North America and Canada introduced.

Records: **SMNK:** Nepal-NW: Lali, 29°38'13"N-80°26'46"E, on a small river with no name, 1230 m, leg. local collectors, ded. Dr.G.Katiwandara, 18.VI.1989 (female #12580).

Discussion:

The authors are aware that the presented checklist may be incomplete. The Himalaya Mountains form a natural barrier to China in the north and therefore a dispersion of Mantodea from the north by wind and animal or human activities can be excluded (BEIER 1939, WERNER 1909). The immigration of new species from the five neighbouring states of India is, however, very likely and possible at any time.

The enormous altitude range in Nepal (the lowest point about 65 m a.s.l. located in the south and the highest point at 8848 m a.s.l., Mount Everest, in the north), the particular topography and the presence of a rainy and dry season create many different ecological niches and very heterogeneous types of vegetation. The latter range from the very humid forests of the Ganges Plain, in the south, to the mountain deserts of the Tibetan Plateau, in the north. With a targeted collection in habitats that are suitable for Mantodea, the checklist can surely be extended by several species.
